

ABSTRACT

In a connection method for connecting an end of a signal wire (53) of a cable (51) to the connecting face of a contact (59) of a connector (52) the cable (51), in which the lengthwise direction of the connecting face and the lengthwise direction of the conductor (53) are mutually matched in connection, the end of the signal wire (53) is pressured against the connecting part by a pair of electrodes (69A, 69B) disposed in mutual separation in the lengthwise direction of the signal wire (53) and an electric current is passed between the pair of electrodes (69A, 69B), and thereby the end of the cable (51) and the connecting part are mutually welded.
